Professional Summary

Results-driven Full-Stack Software Engineer with expertise in the MERN stack. Proven track record of architecting scalable backend systems, developing highly responsive React/Angular frontends. Adept at system optimization, database modeling, and implementing robust security practices to deliver seamless user experiences.

Skills

- **Frontend:** React.js, Next.js, Angular, TypeScript, Tailwind CSS, Zustand, TanStack Query, Redux, HTML/CSS
- **Backend:** Node.js, Express.js, NestJS, Fastify, REST APIs, GraphQL, RabbitMQ, Sockets
- **Databases:** MongoDB, PostgreSQL, Redis, MySQL
- **Tools & DevOps:** AWS, Docker, Kubernetes, NGINX, CI/CD, Git, Github, Jira, Postman

Experience

MERN Stack Developer | Accorelate | Remote | Jan 2026 – Jun 2026 | Stack: React.js, Node.js, Fastify, TypeScript, PostgreSQL

- Developed and maintained features for a voice-enabled, AI-powered billing and accounting platform targeting India's MSME and SME segment.
- Built responsive React.js frontend components with TypeScript, enabling GST-compliant invoicing, cash flow tracking, and inventory management modules.
- Designed and integrated RESTful APIs using Node.js and Fastify, contributing to a scalable backend architecture supporting real-time financial processing and multi-role users.

Self-Taught MERN Stack Developer | Brototype (Brocamp) | Kochi, Kerala | Nov 2023 – Apr 2025 | Stack: MongoDB, Express.js, React.js, Node.js, TypeScript

- Completed a 16-month intensive, self-paced MERN stack development program at Kerala's leading software training institute.
- Built and deployed 3 full-stack applications independently, covering e-commerce, social media, job portals.
- Mastered the full JavaScript ecosystem and Applied industry-standard practices.
- Developed strong self-learning and problem-solving skills by working through real-world project scenarios without a structured classroom environment.

Projects

Wearhaus (E-Commerce Platform)

- Engineered a robust REST API architecture using Node.js, Express, and TypeScript, powering distinct User and Admin portals with advanced hierarchical category, product, and verified-review management.
- Developed a highly responsive, modern e-commerce interface using React (Vite) and Vanilla CSS Modules, delivering a pixel-perfect User shopping portal and a comprehensive Admin management dashboard.
- Secured data integrity using MongoDB Transactions to safely orchestrate thousands of concurrent cart modifications, inventory allocations, and digital wallet deductions without race conditions.

- Architected a mathematically precise checkout engine integrating Razorpay and decimal.js, bypassing native JavaScript limitations to guarantee 100% accurate tax, coupon, and payment computations.
- Engineered a dynamic cart and checkout flow that instantly injects active category/product discounts, auto-corrects final prices in real-time, and seamlessly handles split payments between digital wallets and Razorpay.
- Built strict UI safety mechanisms and validations that dynamically disable purchase buttons based on real-time server inventory caps, proactively preventing stock hoarding and client-side overselling errors.

Hireflow (Recruitment Interface / ATS)

[Live](#)

- Engineered a robust REST API architecture using Node.js, Express, and TypeScript, utilizing a strict N-Tier pattern to establish clean boundaries between business logic and database operations.
- Developed a highly responsive recruitment interface using React (Vite) and Tailwind CSS, engineering a utility architecture using class-variance-authority, clsx, and tailwind-merge to build highly flexible, conflict-free UI components.
- Secured critical data integrity using MongoDB Transactions to safely orchestrate thousands of concurrent job applications, ensuring ATS pipeline statuses, employer analytics trackers, and subscription counts are updated atomically.
- Implemented advanced client-server state synchronization using TanStack React Query for background data fetching, paired with Zustand for persistent global state management across complex AI-generation workflows.
- Architected a fault-tolerant Axios request queue that intercepts 401 Unauthorized errors to silently refresh expired authentication tokens, automatically replaying paused API requests without disrupting the user session.
- Built a multi-tier SaaS monetization engine integrating Razorpay, paired with a programmatic document pipeline that dynamically draws legally compliant PDF tax invoices using PDFKit.

Connectsphere (Social Media Platform)

[Live](#)

- Built the core backend architecture with NestJS, TypeScript, and PostgreSQL, engineering a highly normalized database schema via TypeORM to efficiently orchestrate complex mutual follower graphs, personalized user feeds, and deeply nested reply hierarchies.
- Developed a highly responsive, mobile-first frontend using Angular 18 and Tailwind CSS, delivering a seamless, immersive interface for personalized feed discovery, interactive ephemeral stories, and dynamic user profile management.
- Engineered an event-driven, low-latency communication engine leveraging Socket.IO and Redis pub/sub to power a robust direct messaging system, featuring instantaneous push notifications, live typing indicators, and cross-device online presence tracking.
- Implemented advanced bidirectional client-server synchronization using RxJS and Socket.IO, ensuring instantaneous optimistic UI updates across nested comment threads, live notification badges, and real-time chat interfaces.
- Secured the platform using a comprehensive authentication layer employing Passport.js for strict JWT-based session validation, seamlessly integrating Google and Facebook OAuth 2.0.
- Optimized platform scalability and large-scale data delivery by architecting robust offset-based pagination and strategic query indexing, supported by a pluggable media pipeline that safely processes user image uploads to Cloudinary.
